band specification	A Payload Encoding (PE) and Rank associated with a given band. A band is a single combination of baud rate, modulation type (e.g. QAM or FDQAM) and carrier frequency. Two bands are defined in HPNA VZ
Logical channel, channel	A flow of frames from a sender to one or more receivers on a single network segment, consisting of all the frames with a single combination of DA and SA.
Receiver	A station that receives frames sent on a particular channel. If the destination is a unicast address there is at most one receiver. If the destination is a group address (including broadcast), there may be many receivers.
Receiver PE	The preferred PE to be used on this channel, as determined by the receiver.
RRCF	Rate Request Control Frame. Sent from the receiver to the sender to effect a change in PE.
RefAddr0	The SA in the Ethernet header of the RRCF frame. This is the DA of the receiver (for the channel), and is always used by the channel sender as the first RefAddr processed.
RefAddr1RefAddr <n></n>	Other addresses including Broadcast and Multicast addresses for which the receiver is indicating rate information to the sender. The channel receiver's station address (RefAddr0) should not be out in the list of additional RefAddr s.
	Note1: At least one RefAddr field is necessary to support rate negotiation for Broadcast and Multicast addresses since these cannot be used as the source address in the Ethernet header.
Sender	The sending station for a channel, usually the station owning the source MAC address.
Sender PE	The preferred PE associated with a channel, as noted by the sender.

Field	Length	Meaning
DA	6 octets	Destination Address (FF.FF.FF.FF.FF)
SA	6 octets	Source Address of the station that transmitted this frame
Ethertype	2 octet	0x886c (Link Control Frame)
SStype	1 octet	=3
SSLength	1 octet	Number of additional octets in the control header, starting with the SSVersion field and ending with the second (last) octet of the Next Ethertype field. Minimum is 32 for SSVersion 0
SSVersion	1 octet	=0
CSA_ID_Space	1 octet	Identifies the registration space of CSA_MFR_ID  0 - Unspecified  1 - JEDEC  2 - PCI
CSA_MFR_ID	2 octets	HW manufacturer ID - Identifies the manufacturer of the PHY controller chip. The purpose of this field plus the part number and revision is to identify specific implementations of the PHY specification. This is not a board or assembly-level identifier.
CSA_Part_No	2 octets	HW Manufacturer Part Number - The part number of the PHY controller chip.
CSA_Rev	1 octet	HW Revision
CSA_Opcode	1 octet	0 – Announce 1 – Request
CSA_MTU	2 octets	Maximum size link-level PDU this receiver accepts in octets, the default value is 1526 octets. This is also the minimum value that shall be accepted by all ILINE10 stations
CSA_SA	6 octets	Source address of the station that generated this CSA frame
CSA_pad	2 octets	Reserved for version 0. Shall be sent as 0, ignored on reception.
CSA_CurrentTxSet	4 octets	Configuration flags, plus all current in-use status for this station.
CSA_OldestTxSet	4 octets	A copy of the "oldest" TX flags for this stations, from the period ending at least one period(minute) earlier.
CSA_CurrentRxSet	4 octets	The union of recent flags received from other stations.
Next Ethertype	2 octets	=0
Pad		Pad to reach minFrameSize if necessary
FCS	4 octets	

			Description
Octot	Field	Length	frames with LL priority 7. (always set)

information.	A computed value used to detect newly removed states	Computed values used to detect new status flags.	
	DeleteSet	ıgs,	ReallyNewRxFlags

Spaces Oya	A free-running timer with a period of ou seconds:	in the range 1 ms to 1000 ms, inclusive,			different, or when a CSA is received while and against of the CSP Timer expiring.	timer is cancelled if a second CSA 18 sent as a result of the	
	Cop Timer	COL THREE	PetransmitTimer	THE			

NewTxSet	The set of flags announced during the current CS period, updated immediately when a new link layer priority is used or new volatile status is set. When the CSP_Timer expires, CurrentTxSet is given the value of NewTxSet, and NewTxSet is reset to the
	default set.
PreviousTxSet	The set of flags that were announced during une process.  value of NewTxSet from the previous CS period).
OldestTxSet	The set of flags rolled over from Previous TxSet at the end of the previous CS period (the value of Previous TxSet from the previous CS period). Flags that are present in (the value of Previous TxSet from the previous CS period).
	OldestTxSet and missing from Previous I xSet were not actively used in CSA the sender) for an entire CS period, and will be deleted. This set is sent in CSA the sender) for an entire CS period, and will be deleted.
	frames as CSA_Oldest1xSet.
NewRxSet	The union of all CSA_CurrentTxSet flags received in CSAs from other stations during the current CS period. This is rolled over into PreviousRxSet at the expiration
	of the CSP_Timer, then reset to the empty set (9).
	A volatile status flag (one of the priority flags) in this set may subsequently be deleted if the only station previously announcing that flag stops using it. The deleted if the only station previously announcing that flag stops using it.
	deletion from that station's Current Appendix is noted by the absence of the flag OldestTxSet. The fact that it was the only sender is noted by the glag from no other
	in that station's CurrentRxSet, indicating that it has recorded to the contract of the contrac
	stations.
	Il delected months of the ending value
PreviousRxSet	The set of announced Hags received during in Francis per deleted from this set, as of NewRxSet from the previous CS period). A flag may be deleted from this set, as
	described under NewRxSet above.

	new John State and Developed Dissany new
CurrentTxSet	The set of flags that were announced during the previous Co. Poster during the status and priority flags (or changed configuration/options flags) used during the status and priority flags (or changed configuration/options flags) used this set is sent in current CS period, i.e. the union of Previous TxSet and New TxSet. This set is sent in
	CSA frames as CSA_CurrentTxSet.
CorrentRxSet	The union of NewRxSet, PreviousRxSet. I his set is sent in Co.
	CSA CurrentRxSet.
CurrentInUseSet	The union of CurrentTxSet and CurrenttXSet. This Set is a continuous of CurrentTxSet and CurrenttXSet and to modify the mapping between the LL priority
	operational income actual PHY priority usage.

F16. 52C

Octet	Field	Length	Meaning
Flags0	LARQ_Mult	1 bit	Multiple Retransmission Flag. 0 in the original transmission of a data frame. For retransmitted frames (LARQ_Rtx = 1), set to the value of LARQ_Mult in the NACK-frame that caused the retransmission. This flag can be used by receivers to measure the round-trip times associated with the miss/nack/receive-rtx process.
	LARQ_Rtx	I bit	O for first transmission of a frame, 1 if frame is retransmitted. Stations not implementing LARQ shall drop any data frame if this bit is 1.
	LARQ_NoRtx	1 bit	O if implementation supports retransmission, 1 if only priority is meaningful. May be used on a perchannel basis.
	LARQ_NewSeq	1 bit	1 if the sequence number space for the channel has been reset, and older sequence numbers should not be nacked, 0 otherwise
	LARQ_Ctl	1 bit	"0" when in Encapsulation Format
{	Priority	3 bits	Link Layer Priority of this frame
Flags1_Seq0	Reserved	4 bits	Reserved, shall be 0
	LARQ_seq_high	4 bits	High 4 bits of Sequence number
Seq1	LARQ_seq_low	8 bits	Low 8 bits of Sequence number

FG. 52e

ontrol frame	A frame generated by a LARQ protocol module that contains only a LARQ protocol header as its payload.
Current sequence number	The most recently received new sequence number for a channel.
Data frame	Any standard Ethernet frame from higher (than LARQ) protocol layers. A LARQ-enabled station encapsulates the original payload of an Ethernet frame by inserting a LARQ header (short form control header with LARQ_hdr data) between the source address and the remainder of the frame before the frame is passed down to the driver for transmission on the network.
Forget timer	An implementation dependent mechanism to allow a receiver to reset the sequence number space of a channel when a received sequence number is not the next expected (Current Sequence Number + 1). One second is a suggested default value.
hold timer, lost timer	An implementation dependent timing mechanism that limits the time a receiver will hold onto a received frame while waiting for a missing frame to be retransmitted. Conceptually, there is one such timer per missing sequence number. The timer interval is Maximum Hold Interval.
logical channel, channel	A flow of frames from a sender to one or more receivers on a single network segment consisting of all the frames with a single combination of destination address, source address, and link layer priority.
NACK, Nack, nack	An indication from a receiver to a sender requesting retransmission of one or more frames. Also, the action of providing such an indication. E.g. "to nack a sequence number" meaning to send a NACK indication.
NACK timer	An implementation dependent timing mechanism used by a receiver to retransmit NACKs for missing sequence numbers. Conceptually, there is one such timer per missing sequence number per logical channel. The timer is reset each time a NACK is sent for a sequence number. The timer interval is NACK Retransmission Interval.
new	A new sequence number is one whose difference from the current sequence number for the channel, modulo the size of the sequence number space and considered as a signed integer, is greater than 0. In particular, the numbers (current + 1) through (current + 2047).
old	An old sequence number is one whose difference from the current sequence number for the channel, modulo the size of the sequence number space and considered as a signed integer, is less than or equal to 0. In particular, the numbers (current - 2048) through (current) are old. Note, however, that most of the old sequence numbers are also out-of-sequence.

out of sequence	Any sequence number that falls outside a reasonable range, old or new, of the current sequence number for a logical channel is considered out of sequence. It is recommended that plus or minus twice the value of MaximumSaveLimit (defined below) be used as the "reasonable range" when checking for out of sequence.
receiver	A station that receives frames sent on a particular channel. If the destination address is a unicast address there is at most one receiver. If the destination address is a group address (including broadcast), then there may be many receivers.
reminder	A control frame sent by the channel sender with the most recently used sequence number for a channel which has been inactive for Reminder Interval after its most recent data frame.
reminder timer	An implementation dependent timing mechanism used by a sender to generate a reminder frame after a period of inactivity for a channel. The timer is reset each time a new data frame is transmitted. Conceptually, there is one such timer per channel. The timer interval is Reminder Interval.
save timer	An implementation dependent timing mechanism that limits the time a sender will save a frame waiting for retransmission requests. The timer interval is Maximum Save Interval.
sender	The sending station for a channel, usually the station owning the source MAC address.
sequence numbers	Sequence numbers are maintained separately for each logical channel by the sender.

F16. 52f.z

	The Transit Live and the transit in the live and the state of the stat
Number	The sequence number of the most recently transmitted water in the sequence number of the most recently transmitted water in the sequence number of the most recently transmitted water in the sequence of the most recently transmitted water in the sequence of the most recently transmitted water in the sequence of the most recently transmitted water in the sequence of the most recently transmitted water in the sequence of the most recently transmitted water in the sequence of t
Reminder Timer Interval	A fixed interval. The default is 50 ms. Lower values will increase the
	latency for end-of-sequence frames requiring retransmission.  Implementations should not use values outside of the range 25-75 ms, based Implementations should not use values.
	on 150 ms maximum save and more
Minimum Retransmission	An interval used to prevent too-frequent retransmissions of a single manner.
Interval	Most important for mulicast chamines:
Maximum Save Limit	The maximum number of frames that will be saved for a single logical
	channel. I his is implemented to support. Values of 100 or more can be
	useful for high-speed applications such as video.
2	The maximum time that the sender will normally save a frame for possible
Maximum Save Interval	retransmission. The default is 150 ms.

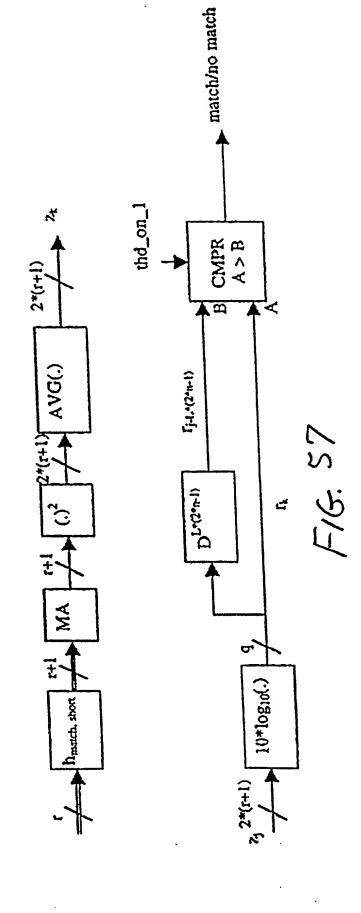

Current Sequence Number	The most recent sequence number received in a LARQ header for the
	Chambel, whether the dam reme
Oldest missing sequence	The oldest sequence number for a frame not yet received which has not been declared lost.
number Maximum Hold Interval	The longest interval that a frame will be held awaiting an earlier missing frame. The default is to use the same value as Maximum Save Interval,
	Which has a delauit of 100 ths
Maximum Receive Limit	The maximum number of frames that a receiver will buffer while awaiting an earlier missing frame. The default should normally be the same as the
	Maximum Save Limit.
NACK Retransmission Interval	The interval after which a receiver will retransmit a Nack control frame for a missing sequence number, with the expectation that earlier Nack control
	frames or data trame retransmissions were lost. The colour in the implementations is 20 ms.

SeqNum	2 octets	Timestamp Sync Message Sequence Number			
Pad		Any value octet			
FCS	4 octets	Frame Check Sequence			

<u>Field</u>	<u>Lengt</u> <u>h</u>	<u>Meaning</u>		
DA	6 octet s	Destination Address		
SA	6 octet s	ource Address		
Ethertype	2 octet s	(TBD) = VOHN Link Control Frame - new IEEE assignment		
Туре	2 octet s	2 = Timestamp Report Message		
Length	2 octet s	Number of additional octets in the signaling frame, starting with Version field and ending with the last octet of the Data Payload field. Minimum is 2.		
Version	2 octet s	= 0		
TSMSeqNum	2 octet s	Sequence number of TSM to which the Timestamp in this message is applicable.		
Timestamp	4 octet s	Timestamp of a previously transmitted Timestamp Report Message, corresponding to TSMSeqNum.		
Frequency	2 octet s	Resolution of the timestamp and Gtimestamp fields, in ticks/1.000ms. For example, value 32768 corresponds to one clock tick at 32.768Mhz, in which the LSBit of the Timestamp corresponds to a time of 0.030517578125usec. The Timestamp will rollover every 131 seconds = 2.2 minutes		
NumGrants	2 octes s	Number of Grant Timestamps specified in the payload of this control message. NumGrants may be zero. Each grant timestamp is accompanied by a Line ID and Call ID field. Including the Grant Timestamp, the total for each grant timestamp is 8 bytes.		

FIG. 77(1)

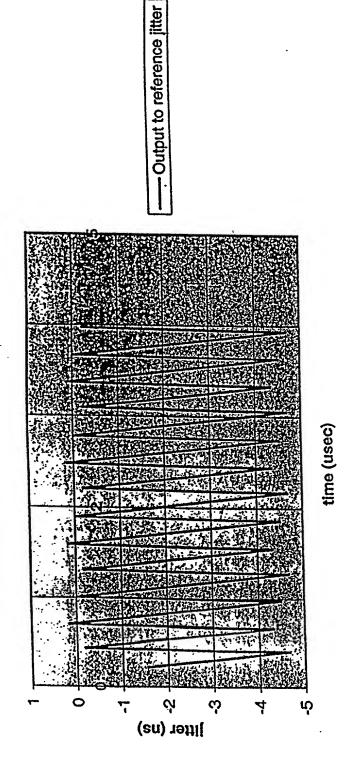

Line ID	octet	Identifier of the Line termination associated with the immediately following GTimestamp.	
Call ID		Identifier of the call instance on the Line termination associated with the immediately following GTimestamp.	
GrantTimest amp	4 octet s	Grant Timestamp corresponding to the immediately preceding Line ID. This is the time at which the Proxy Gateway wishes to receive a future constant bit rate service flow packet in order to minimize delivery latency to subsequent delivery to a synchronous network. The time value corresponds to the time at the timing master. Additional packets for the identified service flow are expected to arrive at periodic intervals measured from this time.	
•••		additional instances of {Line ID, Call ID, Grant Timestamp} field tuples	
Pad -		Any value octet	
FCS	4 octet s	Frame Check Sequence

F16,83a

Bit locations	Field name	Description
7-3	Reserved	
2	TsReset	When set to 1, forces timestamp register to value of 0x00000000. When set to 0, allows timestamp register to increment by one for each detected DPLL_REF_CLK rising edge.
1	SGrant	When set to 1, causes timestamp to be latched into txTimeStampHigh and txTimeStampLow registers whenever the value of tscSID matches the value of input pins Grant[3:0] and Grant[4] is asserted. When set to 0, disables txTimeStampHigh and txTimeStampLow latching under the stated conditions.
0	TMaster	When set to 1, enables txTimestampHigh and txTimestampLow registers to be latched with timestamp values at times determined by frame transmissions (through the LTS descriptor bit) or grant events (through the sGrant descriptor bit). When set to 0, enables txTimestampHigh and txTimestampLow registers to be latched with timestamp values at times determined by txTimeStampHigh and txTimeStampLow register read accesses.

Default value of this register is 0x05

F16,836

Bit locations	Field name	Description
7-4	Reserved	
3-0	SID	SID value that is to be matched by Grant[3:0] pins in order to cause a grant timestamp value to be latched. When the Grant[3:0] pins match the SID value and the Grant[4] input is 1 and the sGrant register bit is 1, then the current timestamp value will be latched into the txTimeStampHigh and txTimeStampLow registers.

Default value of this register is 0x00

Bit locations	Field name	Description
15-0	txTimeStampL ow	Least significant 16 bits of the latched tx timestamp value

Default value of this register is undefined.

F16.83 d

Bit locations	Field name	Description
15-0		Most significant 16 bits of the latched tx timestamp value

Default value of this register is undefined.

F16.83e

Bit locations	Field name	Description
15-0	rxTimeStampL ow	Least significant 16 bits of the latched rx timestamp value

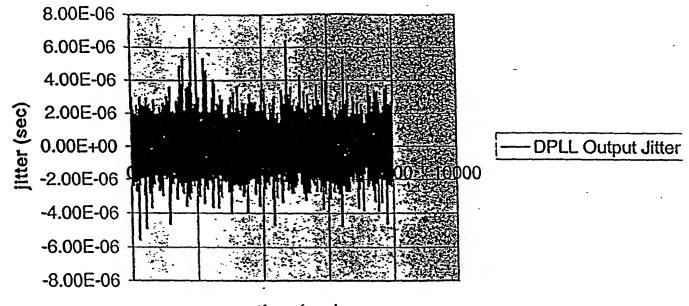

Default value of this register is undefined.

F16.83f

Bit locations	Field name	Description		
15-0	rxTimeStampH igh	Most significant 16 bits of the latched rx timestamp value		

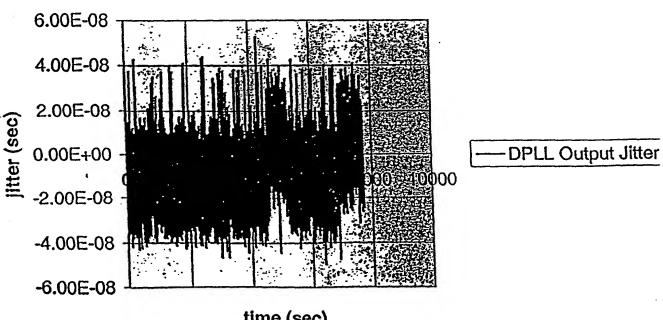

Default value of this register is undefined.

m\_j\_dev=0ppm

time (sec)

<u>Field</u>	<u>Length</u>	<u>Meaning</u>		
DA	6 octets	Destination Address (FF.FF.FF.FF.FF)		
SA	6 octets	Source Address		
Ethertype	2 octets	0x886c (HPNA Link Control Frame)		
SSType	1 octet	= TBD		
SSLength	1 octet	Number of additional octets in the control header, starting with the SSVersion field and ending with the second (last) octet of the Next Ethertype field. Minimum is 16.		
SSVersion	1 octet	= 0		
TRM_type	1 octet	Value of x00 means that this is a TRM containing a valid timestamp. Value of x01 means that the master does not have a valid clock and slaves should give local indication that they are no longer locked to a master reference. Value of x80 means that this is a TQM. Value of x81 means that this is a TSM. All other values are reserved.		
TRMSeqNum	2 octets	Timestamp Report Message Sequence. Number for this message. Sequence number of x0000 indicates an initial TRM, implying that Timestamp and PrevTRMSeqNum are both invalid.		
PrevTRMSeqNu m	2 octets	Sequence number of TRM to which the Timestamp in this message is applicable. The value of PrevTRMSeqNum is not necessarily equal to TRMSeqNum minus one. PrevTRMSeqNum is set to x0000 for the first TRM of a TRM pair.		

F16. 85(1)

<u>Field</u>	<u>Length</u>	Meaning
Timestamp	4 octets	Timestamp of a previously transmitted Timestamp Report Message, corresponding to PrevTRMSeqNum. The LSBit of the Timestamp corresponds to a time of 0.030517578125µsec = one clock tick at 32.768MHz. The Timestamp will rollover every 131 seconds = 2.2 minutes.
NumSlots	1 octet	Number of Slot Timestamps specified in the payload of this control message. NumSlots may be zero. Each Slot Timestamp is accompanied by a MACAddr, and Channel_ID field. Including the Slot Timestamp, each Slot Timestamp is 12 bytes long.
PAD_0	3 octets	Padding to align to a 32-bit boundary. Always present, even when NumSlots has the value of 0.
MACAddr	6 octets	MAC Address associated with the immediately following Channel_ID and STimestamp.
Channel_ID	2 octets	Identifier for a channel associated with the immediately preceding MACAddr.
STimestamp	4 octets	Slot Timestamp corresponding to the immediately preceding Channel_ID. This is the time at which the TRM sender wishes to receive a future constant bit rate service flow packet in order to minimize overall latency of delivery to a synchronous network. The time value corresponds to the time at the timing master. Additional packets for the identified service flow are expected to arrive at periodic intervals measured from this time. The LSBit of the STimestamp corresponds to a time of 0.030517578125µsec = one clock tick at 32.768MHz.
MACAddr	6 octets	MAC Address associated with the immediately following Channel-ID and STimestamp.
Channel_ID	2 octets	Identifier for a channel associated with the immediately following Channel_ID and STimestamp.

F16.85(2)

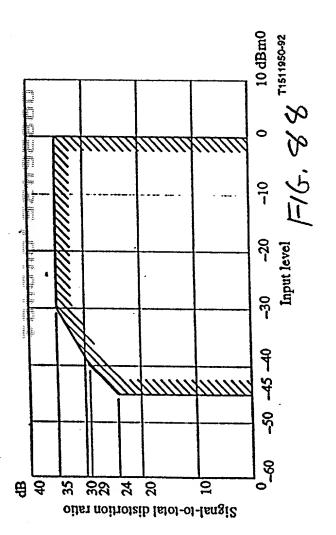

Field	Length	<u>Meaning</u>
STimestamp	4 octets	Slot Timestamp corresponding to the immediately preceding Channel_ID. This is the time at which the TRM sender wishes to receive a future constant bit rate service flow packet in order to minimize overall latency of delivery to a synchronous network. Additional packets for the identified service flow are expected to arrive at periodic intervals measured from this time. The LSBit of the STimestamp corresponds to a time of $0.030517578125\mu\text{sec} = \text{one}$ clock tick at $32.768 \text{ MHz}$ .
